# Initial POV

We met Lauren Kim, a professional golfer in the Palo Alto area.

We learned that the decisions that she makes during a tournament depends on her knowledge of the course beforehand.

It would be game-changing if we could use mixed reality technology to help people like Lauren make better-informed decisions.

Eleni  
Spanos

### **Frequent online shopper**

Uses sites like Amazon  
3-5 times a week

“You can never tell the  
quality of what you’re  
purchasing [online]  
unless you’re familiar with  
the brand.”

Rachel  
Berryman

### **Macy’s employee**

Online shoppers often  
come to find items in  
store

“Customers get  
frustrated when they  
can’t find what they’re  
looking for.”

Enoch  
Park

**Not a frequent shopper**

“I just find it really boring.”

Buys items off Amazon  
after seeing them in store  
because it is often  
cheaper

Travis

**Accompanied girlfriend  
shopping**

Usually doesn't buy  
anything and is often just  
waiting for his girlfriend

... and others!

# POV #1

We met with Rachel Berryman, an employee of Macy's.

We learned that the shopping experience for many Macy's customers can be disorienting and frustrating, especially when a customer has a specific item in mind but is unable to find it in the store in a timely manner.

It would be game changing if we could make it easier for customers to find items in stores.

# VICTORIA'S SECRET

## POV #2

We met with Travis, a man waiting for his girlfriend outside of a Victoria's Secret with his French bulldog.

We learned that Travis does not enjoy shopping at all, but he prefers in-person shopping to online shopping since he does not trust online reviews.

It would be game changing if we could develop a system which people like Travis could use to minimize the amount of time that they spend in a store.

# POV #3

We met with Eleni Spanos, someone who defines themselves as an extreme online shopper.

We learned that she has a difficult time purchasing clothing online since the sizing is unpredictable.

It would be game changing if we could determine how clothing would fit on you before purchasing it online.

HMW make it easier for people to find clothes online that fit?

HMW make shopping more bearable by gamifying the shopping experience?

HMW make it easier for customers to find items in stores?

# Prototype #1

Scan clothes in our closet/in store to share with friends to virtually try on

- Created a paper prototype and utilized the user's phone camera
- User looks through items in a friend's virtual closet and selects clothes to try on
- User opens camera on phone in front of a mirror and overlays paper cutouts of the chosen clothes on their phone

# Prototype #1

## What Worked

- Paper cutouts were a decent substitute for AR
- “It actually looks like I’m wearing it!”

## What Didn’t Work

- Front-facing camera won’t be able to show entire body, so a mirror is necessary

## Surprises/Learnings

- “What’s the end goal?”
- No practical use for trying on friend’s clothes

# Prototype #2

Crowdsource information on products

- Created using a blank sheet of paper, a pen, and imagination of user
- User should recall the last time they were disappointed with an item they tried on, draw it on the paper, and then try the item on (with mirror, AR style)
- Add review bubbles to item on paper and have user try the item on again

# Prototype #2

## What Worked

- Seemed interested in having interactive reviews

## What Didn't Work

- User had to use a lot of imagination to “try on” the drawn item
- User didn't agree with some of the opinions in the reviews

## Surprises/Learnings

- Style advice and fitting is too subjective to successfully crowdsource reviews

# Prototype #3

Swipe through different clothing options on a store mannequin

- Created using a “mannequin”, a phone camera, and various pieces of clothing
- Hold articles of clothing up to the “mannequin”
- User looks through camera and swipes an article of clothing to the side
- When user swipes, we swap the swiped item for one of a different style

# Prototype #3

## What Worked

- Being able to see possible outfits while passing a store is appealing

## What Didn't Work

- Needs to be a quick and simple process

## Surprises/Learnings

- May be beneficial to show sizing options as well as brand names
- People don't want to spend a lot of time looking at mannequins

Most viable solution: Prototype #3

People want to see what a store has to offer  
before stepping foot inside

A dimly lit shopping mall corridor with clothing stores and mannequins. The word "Questions?" is overlaid in the center.

Questions?
